

OBJECT RECOGNITION

OBJECT DETECTIVE

What does the AI see?

Object Detective

I. EXPLORATION

1. Hold things up to the camera. What does the AI recognize, and what does it not?
2. Move the "How sure does the AI need to be?" slider all the way to the left. What happens?
3. Move the slider all the way to the right. What does AI overlook now?

II. CHALLENGE

Find an item that the AI recognizes with over 80% and an item that it ignores completely.

III. REFLECTION

The AI knows exactly 80 things. Who decided that and what does it mean for everything she doesn't know?

TRAINING DATA

TRAIN THE AI

You design the system.

Train the AI

I. EXPLORATION

1. Choose two items. Give them real names on the screen.
2. Take 8-10 examples of each from different angles.
3. Test: Does the AI reliably recognize both?

II. CHALLENGE

The bias attempt: Train badly on purpose — pick up one thing only from the front, the other only from the back. Then rotate both. What happens, and what is this problem called in real AI systems?

III. REFLECTION

Here you can easily delete all data at the touch of a button. Where on the Internet would you like to have that?

PRIVACY

PRIVACY SHIELD

Privacy by Design.

Privacy Shield

I. EXPLORATION

1. Look at the camera — your faces will be instantly blurred.
2. Try out the three protection styles. Turn off the protection for a moment: How does the difference feel?
3. Test the limits: turn your head, put your hand in front of half your face, sunglasses, etc..

II. CHALLENGE

Find two ways in which protection fails. Note: Why is this a problem with a "promise of protection"?

III. REFLECTION

Recognizing ("there is a face") is not recognizing ("this is Ali from 8b"). Why is this difference so important?

MOVEMENTS

THE DATA TRAIL

Cameras and movement.

The data trail

I. EXPLORATION

1. Open the station and look at the heat map. This data was collected along the way while you were playing!
2. Run a certain path as a group — do you see your trail emerge?
3. Press "Delete Data Track". Who should have this button in real life?

II. CHALLENGE

Name three things that could be read from such a map about a room and its people — without any faces.

III. REFLECTION

"I have nothing to hide" — does this also apply to your walking routes, your habits, your favorite corner?

FACES AND FAKES

FOOL THE AI

Images and consequences.

Fool the AI

I. EXPLORATION

The four challenges are on the screen.

Invisible 🕶️ · Confusion 🎩 · Bull's ¹⁰⁰👁️ · 🧛 Ghosts

II. CHALLENGE

Complete at least two challenges and record how it worked.

Your tricks are the insight!

III. REFLECTION

You outsmarted an AI in a few minutes. What does this mean for places where AIs alone make decisions — border control, application, autonomous driving?

MOVEMENTS

SKELETON MIRROR

Motion detection.

Skeleton Mirror

I. EXPLORATION

1. Stand in front of the camera — you will become stick figures with 17 points.
2. Play the Poses course: Who can do all four poses the fastest?
3. Turn on ghost mode: no more video, only skeletons. Do you still recognize who is who?

II. CHALLENGE

In Ghost Mode, find three things you can find out about a person even though you never see their face.

III. REFLECTION

Game consoles, fall detectors in nursing homes, cameras in swimming pools that detect drowning people. This is all skeleton tracking. When is it care, when is it surveillance? And who decides that?
