
OBJECT RECOGNITION

OBJECT DETECTIVE

See and recognise.

OBJECT DETECTIVE

I. EXPLORATION

1. Hold up objects. What does the AI recognise or miss?
2. Move the confidence slider all the way left. What happens?
3. Move it all the way right. What does the AI miss?

II. CHALLENGE

Find one object the AI recognises with over 80% confidence—and one it ignores.

III. REFLECTION

The AI knows exactly 80 things. Who chose them—and what does that mean for everything else?

OBJECT RECOGNITION

TRAIN THE AI

You help shape it.

TRAIN THE AI

I. EXPLORATION

1. Choose two objects. Give them meaningful names on screen.
2. Record 8–10 examples of each from different angles.
3. Test: Does the AI recognise both reliably?

II. CHALLENGE

The bias experiment: train it badly on purpose—record one object only from the front and the other only from the back. Then turn both around. What happens, and what is this problem called in real AI systems?

III. REFLECTION

Here, you can delete all the data at the touch of a button. Where online would you like to be able to do that too?

PRIVACY

PRIVACY SHIELD

Privacy by Design.

PRIVACY SHIELD

I. EXPLORATION

1. Look into the camera—your faces are blurred at once.
2. Try all three styles. Turn protection off briefly: how does the difference feel?
3. Test the limits: turn your head, cover half your face, or wear sunglasses.

II. CHALLENGE

Find two ways the protection fails. Why is that a problem for a promised safeguard?

III. REFLECTION

Face detection (“there is a face”) is not identification (“that is Ali from class 8B”). Why does this matter?

TRACKING

THE DATA TRAIL

Cameras and movement.

THE DATA TRAIL

I. EXPLORATION

1. Open the station and look at the heatmap. This data was collected in the background while you were playing!
2. As a group, walk along a particular route—can you see your trail appear?
3. Press “Delete data trail”. Who should have this button in real life?

II. CHALLENGE

Name three things such a map could reveal about a room and the people in it—without showing any faces.

III. REFLECTION

“I have nothing to hide”—does that also apply to your routes, habits, and favourite corner?

FACES AND GHOSTS

TRICK THE AI

Images and imagination.

TRICK THE AI

I. EXPLORATION

The four challenges are displayed on screen.

Invisible 🕶️ · Mix-up 🎩 · Bullseye 🎯 · Ghosts 👻

II. CHALLENGE

Complete at least two challenges and record how you succeeded. Your tricks are the insight!

III. REFLECTION

You outsmarted an AI in just a few minutes. What does that mean for places where AI systems make decisions alone—border control, hiring, autonomous driving?

MOVEMENT

SKELETON MIRROR

Motion recognition.

SKELETON MIRROR

I. EXPLORATION

1. Stand before the camera—you become stick figures with 17 points.
2. Try the pose challenge: who can complete all four poses fastest?
3. Turn on ghost mode: no video, just skeletons. Can you still tell who is who?

II. CHALLENGE

In ghost mode, find three things you can learn about someone without seeing their face.

III. REFLECTION

Game consoles, care-home fall detectors and pool cameras that detect drowning all use skeleton tracking. When is it care, when surveillance—and who decides?

DISCUSSION CARD

THE SMART DOORBELL

Privacy & AI

THE SMART DOORBELL

The Yilmaz family has a video doorbell. It automatically records the pavement too—including neighbours, postal workers, and children playing. The recordings are sent to the manufacturer's servers in the USA.

DISCUSS

Whose privacy matters here? What would you change if you could design the doorbell?

Hint: Today, you saw a camera that blurs faces before storing the footage.

DISCUSSION CARD

THE STADIUM

Privacy & AI

THE STADIUM

A football stadium wants facial recognition at the entrance: known violent offenders are to be identified automatically. To do this, the faces of all 50,000 visitors are scanned and compared with a database.

DISCUSS

49,990 uninvolved people are scanned to find 10. Is that fair? What if the AI is wrong—you now know it can be?

Hint:

Today, you also trained objects—and possibly faces—yourselves.

DISCUSSION CARD

THE SCHOOL CAMERA

Privacy & AI

THE SCHOOL CAMERA

Your school is considering AI cameras that flag “suspicious behaviour”—fights or vandalism. The school says nothing is stored; the system only raises an alert.

DISCUSS

Would you feel safer—or watched? Does a camera change how you behave, even if it “stores nothing”?

Hint:

Think back to the data trail station and how it worked.

DISCUSSION CARD

THE FILTER

Privacy & AI

THE FILTER

A photo app offers fun AI filters—for free. The fine print says that all uploaded faces may be used to train new AI models.

DISCUSS

Today, you trained an AI yourselves—with data you could delete afterwards. Why do most apps not offer that? What would be a fair exchange for a free filter?

Hint:

Recall your experience of training the AI with objects.

DISCUSSION CARD

THE SUPERMARKET

Privacy & AI

THE SUPERMARKET

A supermarket uses cameras to count anonymously where customers walk and stop—like our heatmap, without faces. The data is used to rearrange shelves and place price labels.

DISCUSS

Is that okay because no one is identifiable? Where do you draw the line between “anonymous statistics” and “manipulation”?

Hint:

Movement data can be collected in other places too.
